

1. Organisation Overview:

Name: [AutoNexa]

AutoNexa was established in **2026 in Johannesburg, South Africa**, after identifying an opportunity to improve the online used-car buying experience. The organisation was created around the idea that purchasing a vehicle should not require customers to visit multiple dealerships, negotiate with different salespeople or struggle to understand the condition and total cost of a vehicle.

AutoNexa's mission is to make buying and selling vehicles in South Africa simpler, safer and more transparent by providing customers with a convenient digital automotive marketplace. To become South Africa's most trusted digital automotive marketplace by creating a transparent, convenient and customer-focused way to buy and sell vehicles online.

❖ Target audience.

Young professionals(25-40 years)

First-time vehicle buyers

Additional customers

2. Website Goals and Objectives:

The main goal of the AutoNexa website is to create an e-commerce vehicle marketplace where customers can complete as much of the vehicle purchasing process online as possible. The website should allow customers to move from browsing to purchasing without unnecessary steps.

3. Current Website Analysis (if applicable):

Strengths

One of the biggest strengths is the large inventory available to customers. The website currently displays thousands of vehicles across different ,makes, models, years and price ranges. Customers can search for vehicles based on criteria such as make, model, year and location. This makes it easier to find a suitable vehicle.

A very large inventory is useful, but having thousands of listings can make the shopping experience overwhelming

AutoNexa should use a cleaner search system with smart filters, best match recommendations, budget-based searching, best for first time buyers, best family cars, best fuel economy, best value.

4. Proposed Website Features and Functionality:

The proposed AutoNexa website will contain five main pages: Home, About Us, Services, Gallery and Contact. The Home page will introduce AutoNexa and immediately communicate its main value proposition to visitors. The About Us page will explain the history, mission, vision and values of the organisation. The Services page will explain services such as buying a vehicle, selling a vehicle, vehicle finance, vehicle inspection, vehicle delivery and trade-ins. The Gallery page will display vehicle listings using images and information such as model, year, mileage and price. The Contact page will provide AutoNexa's contact information together with an enquiry form where customers can submit their details and questions.

5. Design and User Experience:

The primary colour for AutoNexa will be **dark navy**, represented by approximately #0B1F33. This colour will be used for the main navigation and hero sections. The secondary colour will be **blue**, approximately #1677FF, which will be used for buttons, links and other interactive elements. White will be used for content backgrounds, while light grey, approximately #F4F6F8, will be used to separate different sections of the website. The combination of these colours creates a professional automotive appearance and makes important buttons stand out clearly.

The typography will focus on readability and clear information hierarchy. A clean sans-serif font will be used throughout the website because it is easy to read on both desktop and mobile screens. Large bold headings will be used for page titles such as "Our Services" and "Our Vehicle Gallery", while smaller headings will introduce individual sections and vehicle information. Body text will use a smaller regular-weight font so that longer paragraphs remain comfortable to read.

The navigation bar will appear at the top of every page and provide access to the five main pages. Hero sections will introduce each page using a large heading and short supporting text. Content sections will use containers, cards and consistent spacing to prevent the pages from appearing cluttered. The Gallery page will use a grid layout where vehicles are presented as individual cards containing an image, vehicle details, price and enquiry button. The Contact page will use a two-column layout, with contact information on one side and the enquiry form on the other. This structure will make the website easy to scan and navigate.

Customers should be able to find information without unnecessary steps. The navigation menu will therefore remain consistent across the website. Buttons such as "Browse Our Cars", "Enquire Now" and "Contact Us" will clearly communicate what happens when a customer selects them.

The low-fidelity wireframes will show the basic structure of each page before the final styling is applied. The Home page will contain the navigation bar, hero section, introduction and calls-to-action; the About Us page will contain the organisation information; the Services page will contain service cards; the Gallery page will contain vehicle cards; and the Contact page will contain contact information and a form.

6. Technical Requirements:

AutoNexa will require web hosting to make the website accessible online and will use a domain such as autonexa.co.za because the organisation is aimed at the South African market. The hosting package should support the website files, images, security, backups and future database functionality. As the website grows into a full e-commerce platform, a more advanced hosting package may be required.

The current website will be developed using **HTML, CSS and JavaScript**. HTML will provide the structure, CSS will control the design and layout, and JavaScript will provide interactive functionality (MDN Web Docs, 2026). In future, technologies such as React, Node.js and MySQL could be introduced to support a more advanced e-commerce platform.

7. Timeline and Milestones:

The project will be developed in stages according to the subject's submission dates. The first stage involves research and the project proposal, followed by wireframes and website structure. The next stages involve developing the Home, About Us, Services, Gallery and Contact pages, followed by CSS styling, JavaScript functionality and testing. The final stage will involve completing the documentation, README.md, GitHub repository and final submission.

8. Budget:

The estimated commercial development cost for the complete AutoNexa website is approximately **R148,150**. This would include planning, design, front-end development, back-end development, database development, e-commerce functionality, testing and deployment.

The estimated cost for hosting, domain registration, SSL and basic backups is approximately **R2,000–R5,000 per year**, depending on the hosting provider and package selected.

AutoNexa should budget approximately **R72,150 per year** for maintenance. This would cover security updates, backups, technical support, fixing errors, updating vehicle information and making small improvements to the website.
